

Forklift Fork Positioner

Forklift Fork Positioner - The fork positioner is actually a hydraulic device that could allow the person driving to be able to operate the lift truck without leaving the seat. They are constructed out of high quality materials and are designed to be able to withstand the most challenging procedures and work environments. Side shifting models have the added ability to be able to laterally position the arms or the entire load so as to facilitate much more precise lifting and placement in a quicker and more efficient method.

The unique blade pocket design enables the person operating it to be able to securely sway the unit's forks without any worry of destroying the positioning cylinders. This can allow the operator the choice to either execute simultaneous or independent fork movement, dependent upon the job requirement. For most lift trucks with non-OEM carriages, complete carriages are needed. Standard OEM carriages could be converted into fork positioners on existing units.
